

Serial No.: 10/668,773

Amendments to the Specification:

[0001] According to the invention, a web having a repeated sequence of at least two printed pages with different heights is fed in a running direction to a cross-cutting device, where it is cut transversely to the running direction to form sheets having section lengths corresponding to the heights. The invention makes it possible to process webs to form printed products with a wide format variability.
